Hi, My name is Satoru Sasozaki. I came from Japan and a year has passed since I came to the bay area. I graduated from a university back in Japan majoring in History in March 2014. I was going to work for a small company as a sales person after the graduation. But just before the graduation, I got a chance from Osaka city government to visit some startups like Box.com and google and accelerators like 500 startups in palo alto and then I was so impressed to see how passionate and hard the software engineers in those companies work.

After the stay for 2 weeks in the bay area, I go back to Japan, turn down the job offer , and decided to come back here to make cool products at a cool startup as a software engineer. However I have never done any programming and did not speak English at all. So I needed to an environment to get myself ready. So I came to DVC and I am leaning CS.

My goal this year is to get a job as an iOS developer. The reason why I want to be an iOS developer is that simply I like iOS device, and also mobile devices are one of the biggest technologies that are changing the world and iPhone is the best and coolest mobile device. I have been learning iOS development like half a year, but I have never learned in a structured way. That's way I took this class to cover what I miss in iOS development.

I'm also attending an iOS Development Bootcamp by CodePath. Since it's only for existing developers, they didn't allow me to attend to the class on site, but I got to access to the course materials online and following it by myself. Hopefully the people from the bootcamp help me to find an internship opportunity. This is it about myself. I'm really excited to take your class and learn a lot about iOS Development.

Please look at [my website](#) and [github](#).
